DATABASE MANAGEMENT SYSTEM

ASSIGNMENT 7

SAMPLE DATA INSERTION

Hotel Management System

Particular Details	**Information**
Student Name	A Praisy Emberline
Programme	BCA – Artificial Intelligence & Machine Learning
Subject	Database Management System
University	Alliance University
Academic Year	2nd Year

Introduction

Sample data insertion is an important step in testing a database. The INSERT INTO command adds records to tables. This assignment inserts illustrative records into the eight tables of the Hotel Management System while respecting the relationships defined in the schema.

1. Selecting the Database

```
USE Hotel_Management_DB;
```

This command selects the database into which the sample records will be inserted.

2. Inserting Data into Room_Type

```
INSERT INTO Room_Type
(room_type_id, type_name, price_per_night, description)
VALUES
(1, 'Standard', 2500.00, 'Standard room'),
(2, 'Deluxe', 4000.00, 'Deluxe room with extra space'),
(3, 'Suite', 6500.00, 'Premium suite');
```

Three room types are inserted with different nightly prices.

3. Inserting Data into Guest

```
INSERT INTO Guest
(guest_id, guest_name, email, phone, address)
VALUES
(101, 'Akil', 'akil@example.com', '9876543210', 'Bengaluru'),
(102, 'Rahul', 'rahul@example.com', '9876543211', 'Hosur'),
(103, 'Priya', 'priya@example.com', '9876543212', 'Chennai');
```

Three guest records are inserted with unique identifiers and distinct email addresses.

4. Inserting Data into Room

```
INSERT INTO Room
(room_id, room_number, floor_number, room_status, room_type_id)
VALUES
(201, '101', 1, 'Available', 1),
(202, '205', 2, 'Occupied', 2),
(203, '301', 3, 'Available', 3);
```

Each room references an existing room type.

5. Inserting Data into Staff

```
INSERT INTO Staff
(staff_id, staff_name, role, phone, department)
VALUES
(301, 'Ravi', 'Manager', '9000011111', 'Administration'),
(302, 'Anita', 'Receptionist', '9000011112', 'Front Office'),
(303, 'Kiran', 'Housekeeper', '9000011113', 'Housekeeping');
```

Three staff members are added. Staff is independent in the reference schema.

6. Inserting Data into Reservation

```
INSERT INTO Reservation
(reservation_id, guest_id, room_id, check_in_date, check_out_date,
reservation_status)
VALUES
(1001, 101, 202, '2026-08-25', '2026-08-27', 'Checked-in'),
(1002, 102, 201, '2026-08-28', '2026-08-30', 'Confirmed'),
(1003, 103, 203, '2026-08-29', '2026-09-01', 'Confirmed');
```

Each reservation refers to an existing guest and room. These dates follow the supplied reference sample.

7. Inserting Data into Service

```
INSERT INTO Service
(service_id, service_name, service_price, description)
VALUES
(401, 'Room Service', 500.00, 'Food delivered to the room'),
(402, 'Laundry', 300.00, 'Laundry service'),
(403, 'Airport Pickup', 1200.00, 'Pickup from the airport');
```

Three hotel services are inserted.

8. Inserting Data into Payment

```
INSERT INTO Payment
(payment_id, reservation_id, payment_date, amount, payment_method,
payment_status)
VALUES
(501, 1001, '2026-08-25', 9000.00, 'UPI', 'Paid'),
(502, 1002, '2026-08-28', 5000.00, 'Card', 'Paid'),
(503, 1003, '2026-08-29', 13000.00, 'Cash', 'Pending');
```

Each payment references an existing reservation. The amounts and statuses match the sample data in the reference document.

9. Inserting Data into Service_Usage

```
INSERT INTO Service_Usage
(usage_id, reservation_id, service_id, usage_date, quantity)
VALUES
(601, 1001, 401, '2026-08-26', 1),
(602, 1001, 402, '2026-08-26', 2),
(603, 1003, 403, '2026-08-30', 1);
```

The supplied reference describes the Service_Usage table but does not provide sample rows for it. These three illustrative records are added so that all eight tables can be tested.

10. Verifying the Inserted Records

```
SELECT * FROM Guest;
SELECT * FROM Room_Type;
SELECT * FROM Room;
SELECT * FROM Staff;
SELECT * FROM Reservation;
SELECT * FROM Service;
SELECT * FROM Payment;
SELECT * FROM Service_Usage;
```

Each SELECT statement displays the records in the named table.

11. Checking Record Counts

```
SELECT COUNT(*) AS Total_Guests FROM Guest;
SELECT COUNT(*) AS Total_Room_Types FROM Room_Type;
SELECT COUNT(*) AS Total_Rooms FROM Room;
SELECT COUNT(*) AS Total_Staff FROM Staff;
SELECT COUNT(*) AS Total_Reservations FROM Reservation;
SELECT COUNT(*) AS Total_Services FROM Service;
SELECT COUNT(*) AS Total_Payments FROM Payment;
SELECT COUNT(*) AS Total_Service_Usage FROM Service_Usage;
```

Table	**Expected Records**
Guest	3
Room_Type	3
Room	3
Staff	3
Reservation	3
Service	3
Payment	3
Service_Usage	3

Conclusion

Sample records were prepared for all eight tables of the Hotel Management System. The data illustrates guests, room categories, rooms, staff, reservations, services, payments, and service usage. Foreign-key values refer to existing records, so the sample data can be used to test joins, filters, aggregate functions, and other database operations.
